**Aim:** Implement a program on multiple inheritance with interface.

**Objective:** Implement multiple inheritance in a program to perform addition, multiplication and transpose operations on a matrix. Create an interface to hold prototypes of these methods and create a class input to read input. Inherit a new class from this interface and class. In main class create object of this child class and invoke required methods.

#### **Theory:**

- In Multiple inheritance, one class can have more than one superclass and inherit features from all parent classes. Java does not support <u>multiple inheritance</u> with classes. In java, we can achieve multiple inheritance only through Interfaces.
- An interface contains variables and methods like a class but the methods in an
  interface are abstract by default unlike a class. If a class implements multiple
  interfaces, or an interface extends multiple interfaces, it is known as multiple
  inheritance.
- However, Java supports multiple interface inheritance where an interface extends more than one super interfaces.
- A class implements an interface, but one interface extends another interface.
   Multiple inheritance by interface occurs if a class implements multiple interfaces or also if an interface itself extends multiple interfaces.
- The following is the syntax used to extend multiple interfaces in Java:

```
access_specifier interface subinterfaceName extends superinterface1, superinterface2, ...... {

// Body
}
```

#### Code:

```
class MultInherit{
public static void main(String args[])
{
Pig a=new Pig();
a.animalsound();
a.sleep();
```

## Vidyavardhini's College of Engineering and Technology

### Department of Artificial Intelligence & Data Science

```
interface Animal{
public void animalsound();
public void sleep();
class Pig implements Animal{
public void animalsound(){
System.out.println("The Pig says: wee-wee");
public void sleep(){
System.out.println("zzzzzzzz");

```

#### **Conclusion:**

Comment on how interface are useful and implemented using java.

Q Search

Interfaces in Java are a fundamental concept that allows you to define a contract specifying a set of methods that implementing classes must adhere to.

Abstraction: Interfaces allow you to define a contract or a set of methods without specifying the implementation. This promotes abstraction, enabling you to focus on what a class should do rather than how it should do it.
